

# Memorandum

CITY OF DALLAS

DATE March 4, 2024

TO Honorable Chair Stewart and Members of the Parks, Trails, and the Environment Committee

SUBJECT **Office of Environmental Quality & Sustainability Solar Siting Study**

## Background

In November 2022, OEQS issued a request for proposals (RFP) to seek professional assistance “to guide development of solar [photovoltaic (PV)] generating capacity on City-owned property” with the results of the study to “provide short-term and long-term cost analyses of economically feasible potential City-owned or privately-owned (under lease agreement) solar PV assets, emissions reductions associated with those assets, optimal locations for solar PV installations, project priorities and funding options for Council to consider.” The RFP identified the following priorities for this Solar Siting Study:

- Help achieve Comprehensive Environmental and Climate Action Plan (CECAP) renewable energy targets and actions;
- Advance goals of the Racial Equity Plan (REP);
- Reduce energy poverty and support access to renewable energy for low- and moderate-income residents;
- Minimize negative impact to local natural resources; and
- Explore opportunities to support habitat, pollinators, and other environmental resource assets.

The study advances the CECAP Goal 2 commitment to generate and use renewable, reliable, and affordable energy. The Goal 2 targets include the installation of 739 MW and 3,695 MW of solar power within the City by 2030 and 2050, respectively. It also aligns with OEQS’ Department Program Measures in the REP to “[p]rovide access to community solar opportunities for qualified households with the greatest need by December 2025” with the target to “[i]ncrease residential building efficiency through weatherization, access to clean energy through community solar programs, and reduce energy use in historically disadvantaged communities through other related programs.”

In April 2023, OEQS contracted with a consultant team led by Ameresco Inc. to evaluate the City of Dallas property portfolio and identify ten priority sites for further analysis. For these ten priority sites, the consultant team was tasked with providing detailed technical and financial analysis as well as preliminary system designs that could be used as the basis for future solicitations for installation of proposed systems through a later procurement. The team was also tasked with evaluating the demographic profile of the communities adjacent to each site and any potential environmental impacts of solar energy development at the priority sites.

## Project Overview and Approach

The project team evaluated City properties for potential as building-serving sites and community-serving sites. Building-serving sites are properties with a City of Dallas facility or other energy-using infrastructure where a solar PV system can directly offset consumption of electricity from the grid and reduce utility costs. These sites are also referred to as “behind the meter.” Community-serving sites are properties that could host a solar PV system that produces electricity that is delivered to the grid for use by residents and non-City entities. Community solar typically

uses a subscription model where multiple participants subscribe to a portion of the solar energy generated. Subscribers do not receive electricity directly from the community solar system and therefore do not need to be physically located near the system.

OEQS staff initially requested five building-serving and five community-serving sites, and sought to avoid recommendations to install solar carport canopies as an effort to reduce single occupant vehicle use. These directives were modified following the team's presentation to the Environmental Commission on October 11, 2023, based on feedback from Commissioners and technical advisors.

Ultimately, the project team recommended eight building-serving sites, one community-serving site (Dallas Sanitation Department's Southwest Transfer Station), and one site (Martin Luther King, Jr. Community Center) that could be used to offset building electricity use or for community solar, but not both due to technical constraints. The building-serving sites were selected based on economic and technical feasibility; department feedback that identified key constraints; and site visits and document reviews that revealed disqualifying conditions of certain sites.

For community-serving sites, the team identified sites with sufficient space with appropriate conditions to support a solar PV system large enough to potentially overcome economic challenges to community solar and attract interest from: potential community solar developers, who would install the system; and retail electricity providers, who would likely manage the subscription and billing process for a community solar program. The team conducted GIS spatial analysis to evaluate sites, which were then qualified or eliminated based on key environmental criteria and department feedback.

## **Community Engagement and Feedback**

The project team provided two primary community engagement opportunities: an online survey and town hall meetings. An online community survey in English and Spanish was administered in Fall 2023. The three-part survey gauged Dallas residents' awareness and preferences related to:

- Building-serving solar energy development on City-owned properties;
- Community-serving solar energy development on City-owned properties; and
- Residential solar energy options.

The solar siting study project team received 148 valid responses (146 English, 2 Spanish). Responses were geographically dispersed and somewhat demographically diverse, though they likely overrepresent Dallas residents with existing interest and investment in solar. Nevertheless, the survey results provided valuable insights that helped inform the selection of the ten priority solar sites and could inform potential residential and community solar energy program design.

An in-person town hall was held at the West Dallas Multipurpose Center on February 15, 2024, and a virtual town hall was held via WebEx on February 21, 2024. There were approximately 20 attendees representing at least seven zip codes, including three people from two Priority Zip Codes, and three Environmental Commissioners at the town halls. The project team provided an overview of the purpose of the study and the recommended ten sites. The in-person event also included interactive opportunities to engage with community partners to learn more about ways that residents can take climate action and support solar energy.

Attendee feedback included:

- Enthusiasm for the recommended solar installation at the Martin Luther King, Jr. Community Center (MLK Center) in particular. The West Dallas Multipurpose Center was also recommended by attendees for the City to prioritize for early investment in solar energy.

- Support for solar parking canopies to help reduce temperatures at surface parking lots, especially at the MLK Center.
- Interest in educational opportunities, including hands-on solar panel installation learning opportunities for Dallas ISD Career and Technical Education students and onsite signage explaining how solar panels work.
- Curiosity about how the City is promoting solar energy for private property owners and City plans for installing electric vehicle charging stations and battery energy storage as complements to solar energy.
- Interest in the procurement process and timeline for installing solar systems at the recommended sites.

### **Priority Site Portfolio Overview**

The project team identified 3.6 megawatts of solar potential across ten priority sites with the potential to generate 5.4 million kilowatt hours of renewable electricity per year—that’s enough to power 420 Texas homes for a year and avoid more than 69,000 metric tons of carbon dioxide-equivalent (CO<sub>2</sub>e) greenhouse gas emissions by 2050. The nine building-serving solar installations would produce a combined \$2.4 million net positive value over the standard 25-year durable life of solar PV. The portfolio has a 7.1% internal rate of return and would reach simple payback in year 14. The two potential community-serving sites have the potential to support 227 community solar subscriptions and would provide a valuable pilot opportunity for the City to develop a greater understanding of community solar potential and challenges in the Texas market, where community solar is not supported with an organized program and faces market, regulatory, and economic barriers to success. Site-by-site and portfolio technical and financial details are enclosed. A map of the ten priority solar sites with demographic and environmental context is available at [bit.ly/CODSolarSiteMap](https://bit.ly/CODSolarSiteMap).

The proposed preliminary designs and associated financial analysis is based on “as-is” site conditions observed by project team engineers or identified in feedback from Building Services Department (BSD) and departments controlling relevant properties including Parks and Recreation (PKR), Sanitation (SAN), Dallas Police Department (DPD), and Equipment and Fleet Management (EFM). The enclosed cost estimates and financial analysis should be considered preliminary and final determination of required upgrades would be determined at the time of final system design and permitting. The final solar siting study report will include a full and detailed list of inclusions, exclusions, and assumptions that informed the analysis.

The project team recommends aiming to develop the priority site portfolio through a single solicitation. Multiple procurements for individual sites will create delays and inefficiencies that will negatively impact the economic performance of the portfolio and delay associated emissions reductions.

### **Study Final Report**

The project team will submit a comprehensive report detailing study approach, site-level analysis, and recommendations on community solar, funding, and procurement in March 2024.

### **Enclosed**

- Priority site technical and financial overview
- Priority site map with REP priority zip codes
- Town hall presentation

If you have any questions please contact Carlos Evans, OEQS Director (214-670-1642), Paul White II, OEQS Assistant Director (214-671-8979), or Rosaerlinda Cisneros, OEQS Climate Coordinator (214-670-1196).

25 Yr Net Cash Flow at 4.3% financing	1,970,313	398,882	80,137	105,680	126,638	176,821	7,769	240,187	194,847	2,330,710

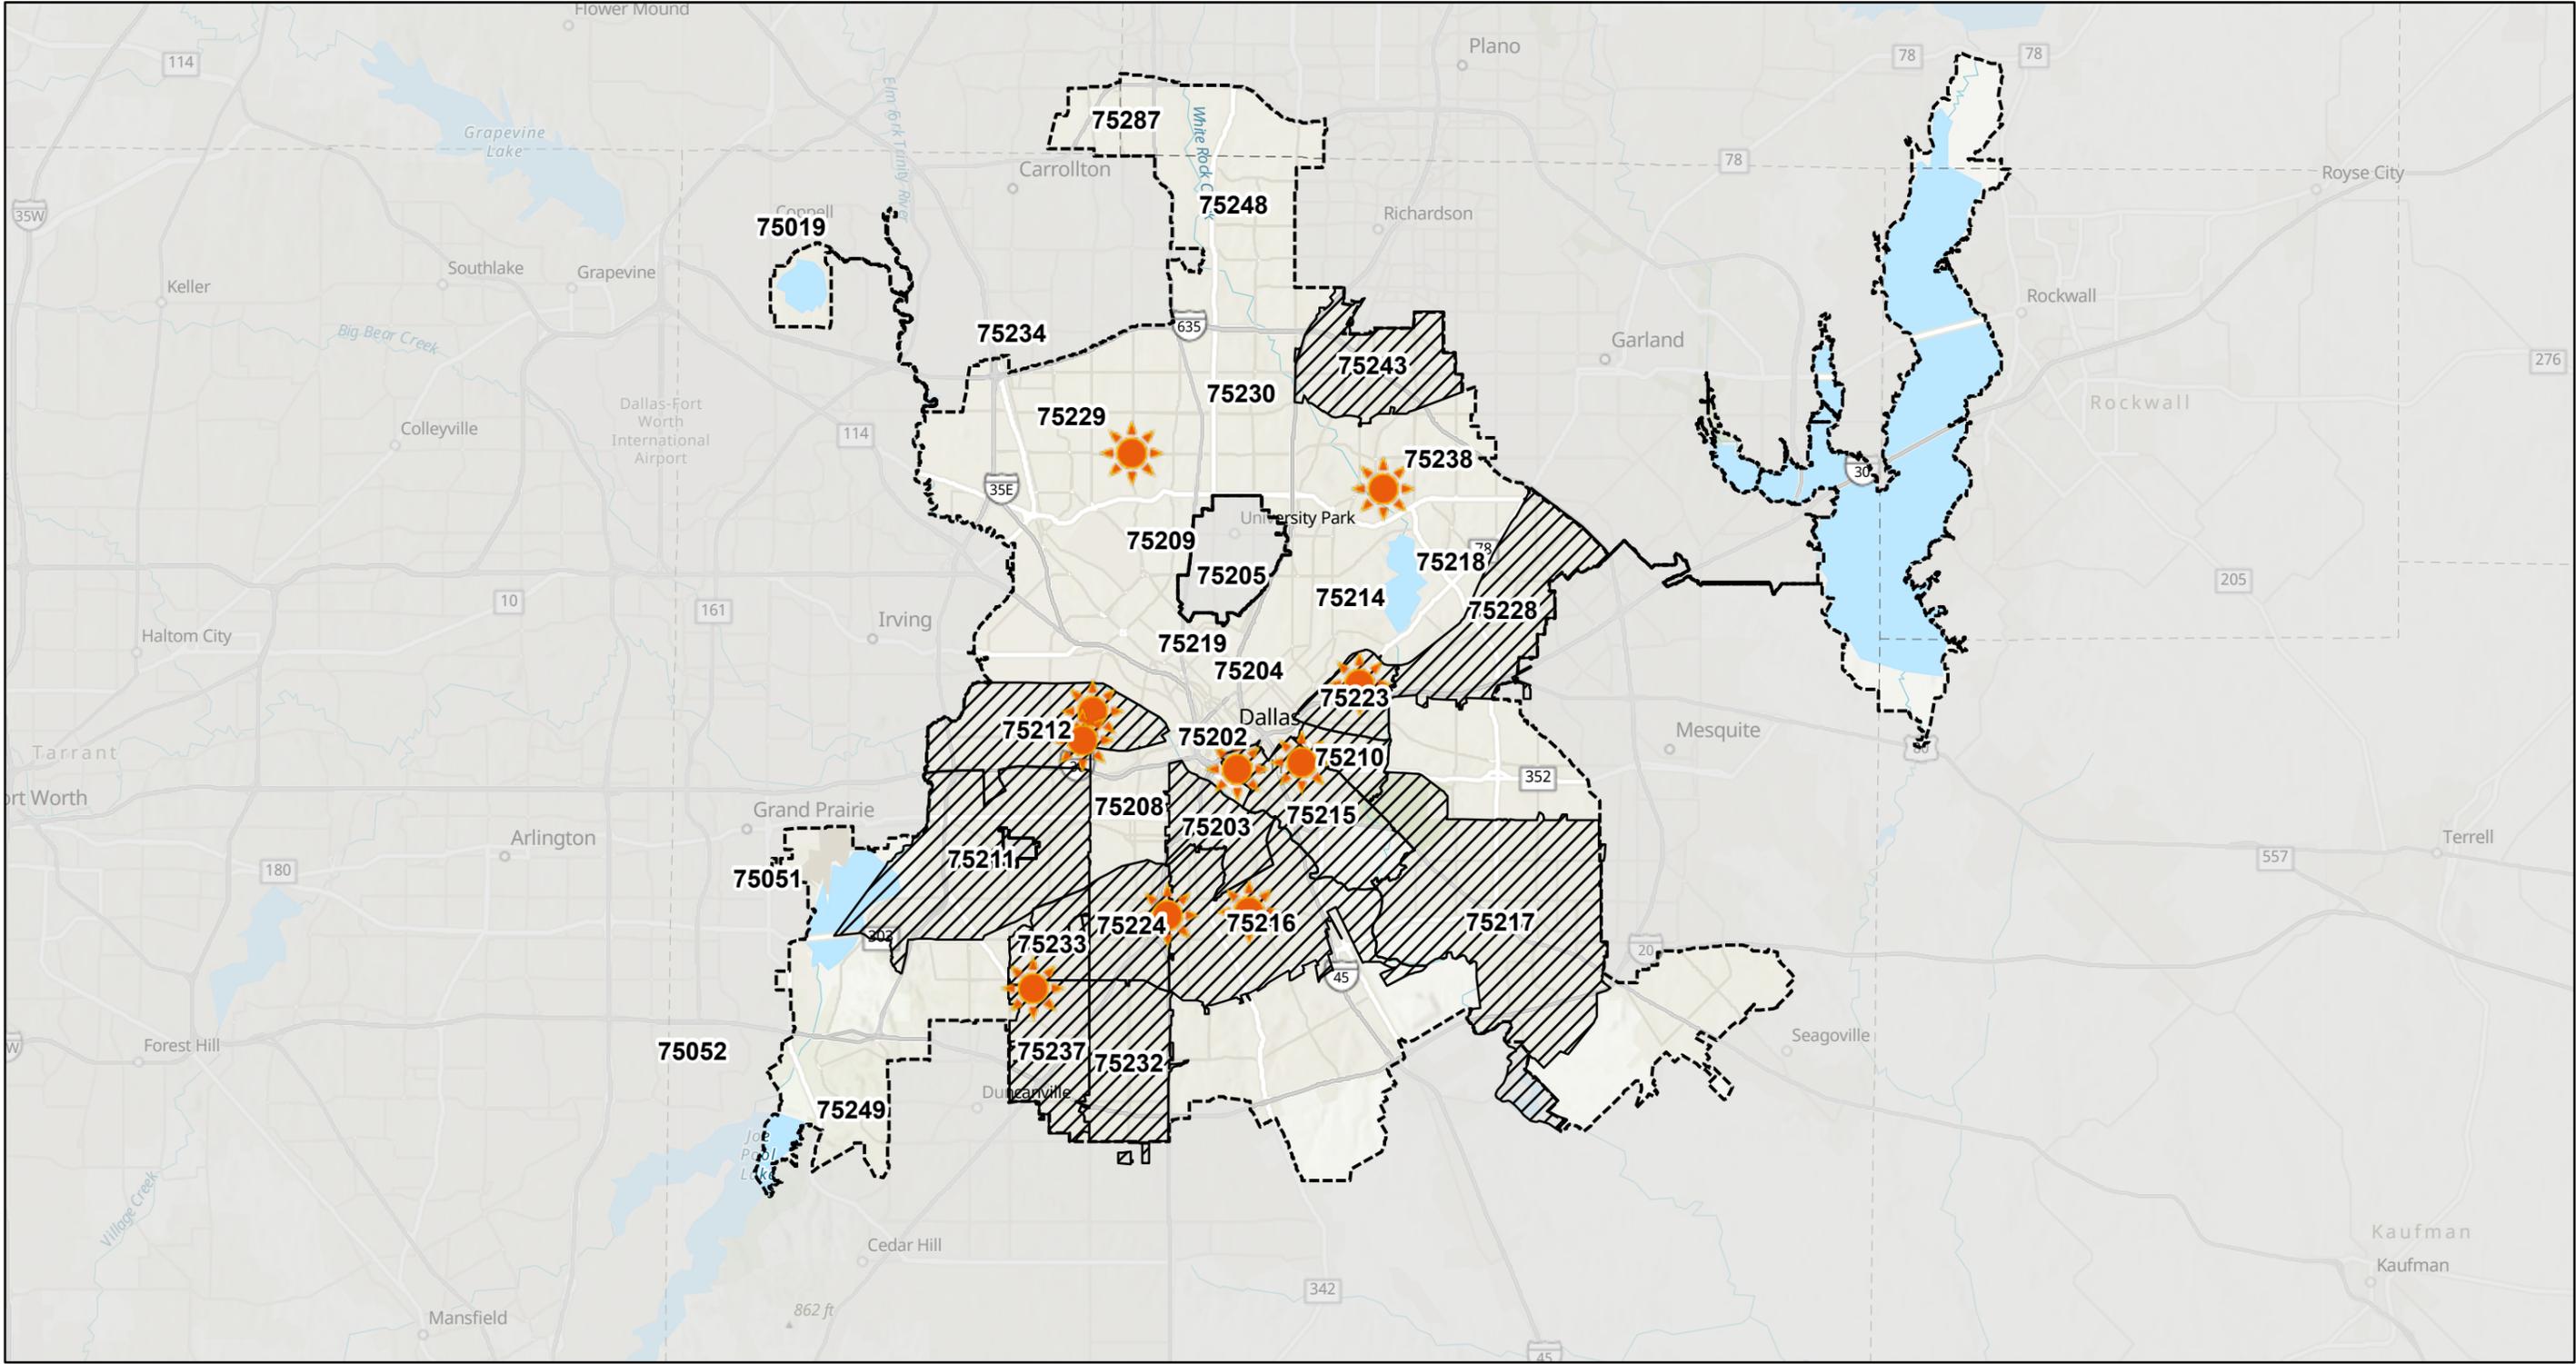

The proposed preliminary designs and associated financial analysis is based on “as-is” site conditions verified by project team engineers through site visits, provided building documentation, and feedback from Building Services Department (BSD) and departments controlling relevant properties including Parks and Recreation (PKR), Sanitation (SAN), Dallas Police Department (DPD), and Equipment and Fleet Management (EFM). **Although the consultant team quantified costs associated with standard installation conditions and known technical constraints, the provided cost estimates and financial analysis should be considered preliminary.** Project team engineers did not observe the need for specific upgrades to building electrical infrastructure or roof replacements however final determination of required upgrades would be determined at the time of final system design and permitting. **Turnkey purchase price does not include value of any incentives. Other financial metrics assume securing a 30% Investment Tax Credit using the elective pay process and Oncor rebates.** The final solar siting study report will include a full and detailed list of inclusions, exclusions, and assumptions that informed the analysis.

### Community Serving Sites Overview

Community Serving Sites Overview		
Site Name	Installation Price	# of Community Solar Subscriptions
Martin Luther King Jr. Community Center	\$4,620,273*	119
Southwest Transfer Station	\$4,099,586	108

\*Installation price for this site differs from building serving price due to increased costs associated with direct interconnection to Oncor distribution grid

of solar power  
installed

**50% of**  
**residents + businesses**  
enrolled in a renewable  
electricity plan

# Why Solar For City Properties?

SELECT ANY ACTION TO SKIP DIRECTLY TO THAT PAGE

**02** Dallas generates and uses renewable, reliable, and affordable energy.

**Maintain a high degree of reliability during extreme weather events.**

- Maintain a high degree of reliability in the electric delivery grid through cooperative actions between the City and Public Utility Companies.
- Evaluate the potential for the City to make investments in energy storage technologies for both resilience and renewable energy development purposes.
- Educate commercial power users about power savings associated with demand side management.

**Encourage investment in, and greater use of, renewable energy.**

- Continue partnership with Public Utility Companies on an intensive education program on renewable energy options.
- Invest in programs through local community colleges to train and establish a local workforce that is focused on renewable energy technologies.
- Build a regional strategic partnership to promote adoption of renewable energy.
- Establish and invest in renewable energy hubs through partnerships with private sector.
- Extend City efforts to develop more renewable energy projects on City facilities.**
- Continue to implement Green Energy policy for City facilities.

**Ensure affordable access to renewable electricity.**

- Extend partnership with organizations like PACE and other Public Utility Companies to provide further incentives for renewable energy.
- Advocate for Renewable Energy Policies at the State and Federal levels.

# Consultant Team Introductions

- Project lead, technical/financial analysis, system design

- Environmental analysis + GIS

- Equity analysis + community engagement

- Community solar analysis

# Solar Association

# Solar Siting Study Scope

## Initial Assessment Factors:

- Large City-owned properties near low- and moderate-income (LMI) communities
- Available space + amenable site conditions
- Maximize offset of building electricity use
- Cost-neutral to City
- Preserve tree canopy and open space
- No impact to protected species
- Preference to minimize solar parking canopies (carports)
- Ability to pilot newer technologies
- Community solar program potential

## Adjustments Based on Feedback:

- Considered entire City of Dallas portfolio
- Sites eliminated based on department's future use plans and 2024 bond
- Preserve sites for housing
- For ground mount solar, adequate setback from trails to protect views
- Select solar carports ok
- Refined economic success criteria and constraints (e.g., City's low cost of electricity)

# Solar Development Options

## Building-Serving Solar Sites

- Solar panels installed onsite that directly serves the building's energy needs
- Can be rooftop, ground mount, or carport
- Avoids use of grid electricity in real time
- Can result in lower electricity costs (but it's complicated)

## Community-Serving Solar Sites

- Solar panels that do not directly serve a nearby building but instead generate electricity for others to purchase through subscriptions
- Can be rooftop, ground mount, or carport
- Are typically larger than Building Serving Solar
- Typically run by a program administrator and facilitated by supportive policy

# Solar Development Options (cont.)

Rooftop

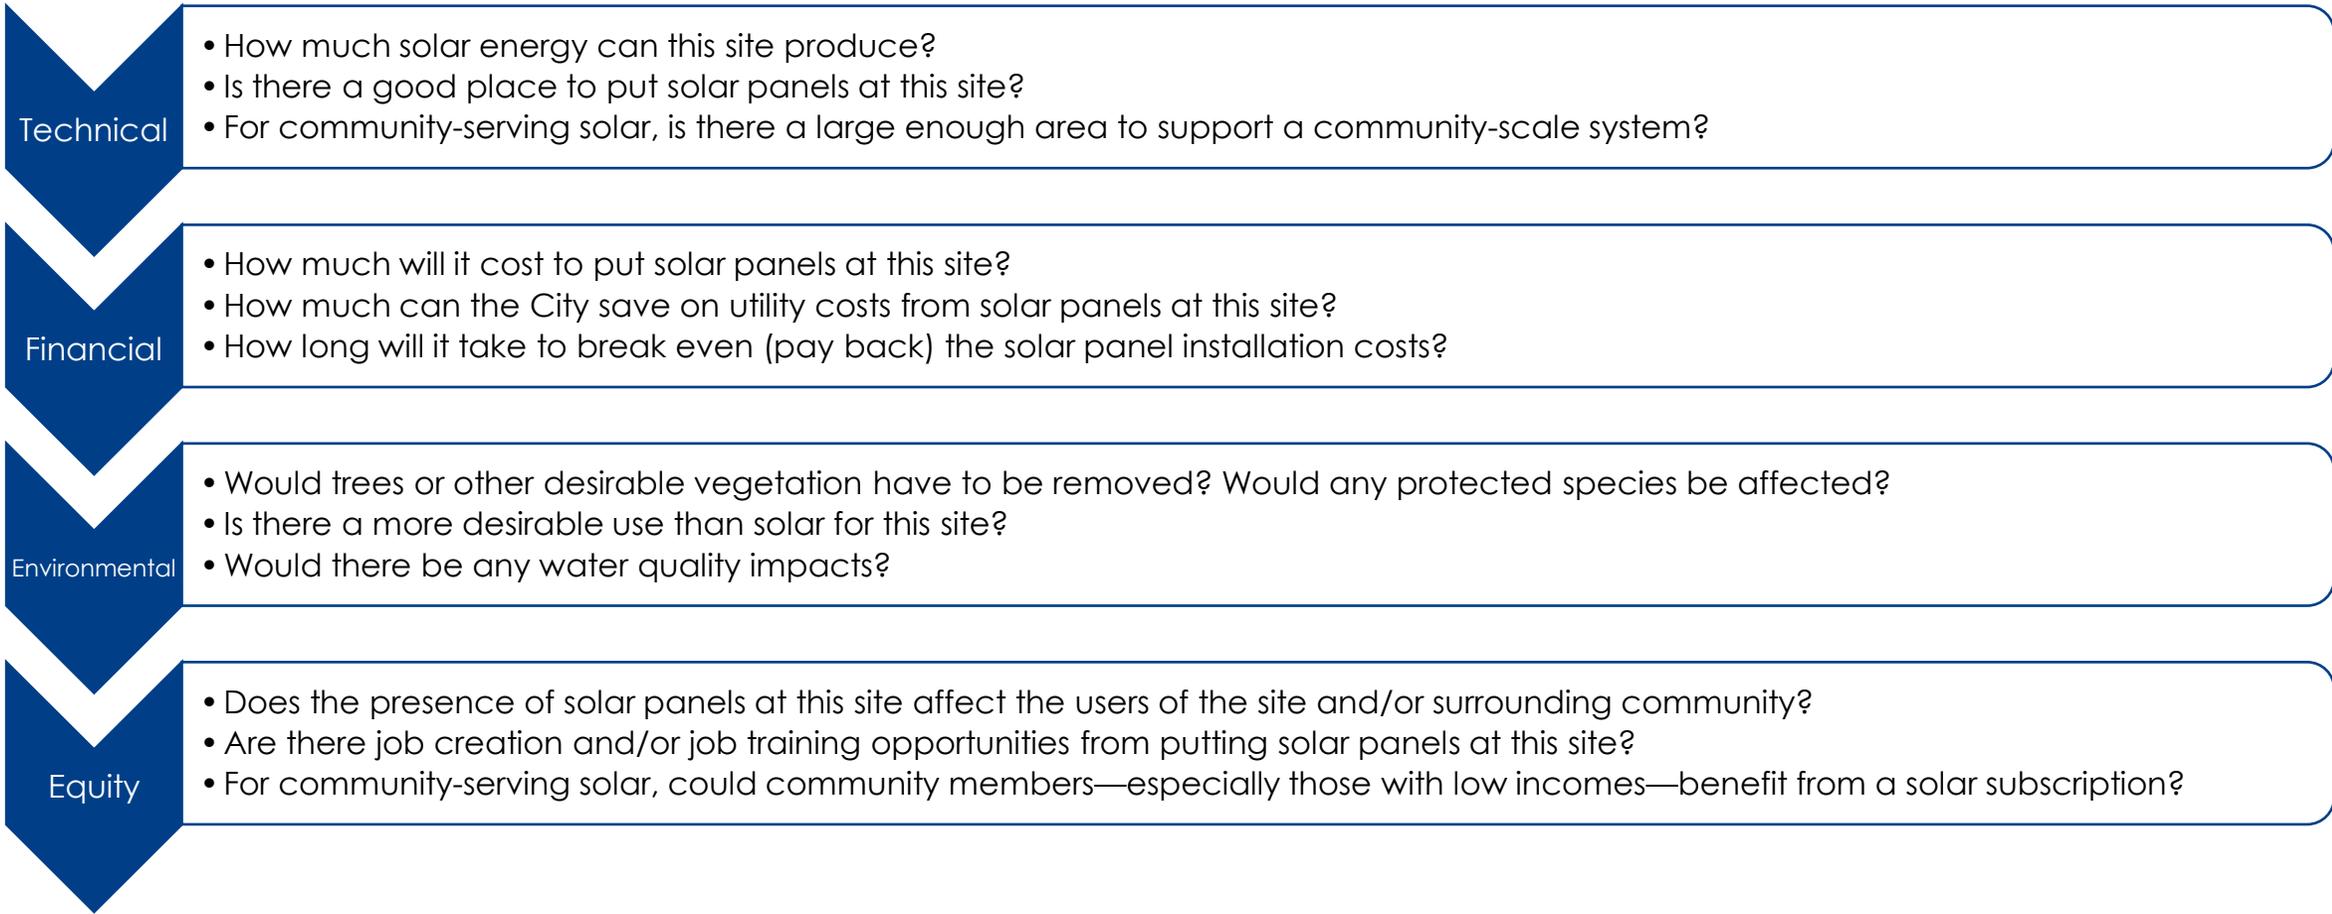

Ground Mount

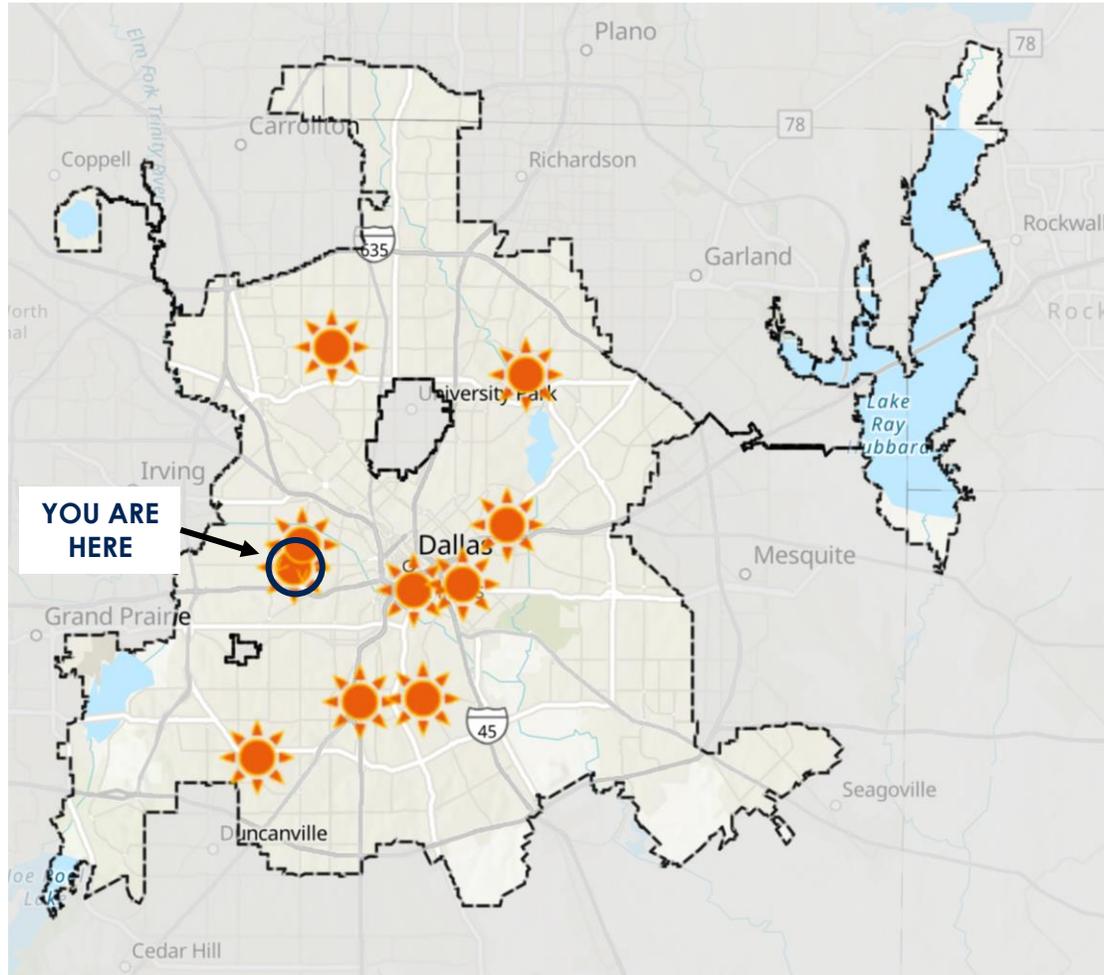

Carport

# Study Approach

# Priority City of Dallas Sites for Solar Development

1. **Martin Luther King, Jr. Community Center\***  
(1,088 kW, rooftop + carport)
2. **Southwest Transfer Station\***  
(961 kW, ground mount)
3. **Paul Laurence Dunbar Lancaster-Kiest Branch Library** (265 kW, ground mount)
4. **Beckley-Saner Recreation Center**  
(253 kW, rooftop + carport)
5. **Walnut Hill Recreation Center**  
(220 kW, rooftop + carport)
6. **Nash-Davis Recreation Center**  
(187 kW, rooftop + carport)
7. **West Dallas Multipurpose Center**  
(169 kW, rooftop)
8. **Samuell-Grand Recreation Center**  
(167 kW, rooftop + carport)
9. **Northeast Service Center**  
(165 kW, rooftop)
10. **Quarter Master**  
(148 kW, rooftop)

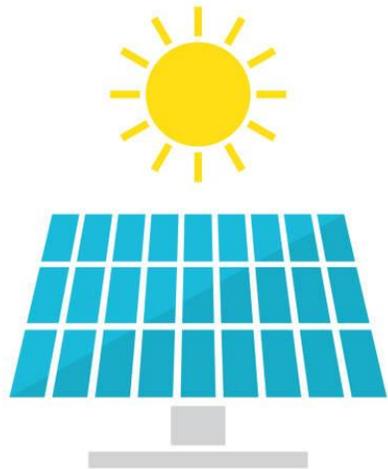

\* Potential community serving sites

# POTENTIAL IMPACT

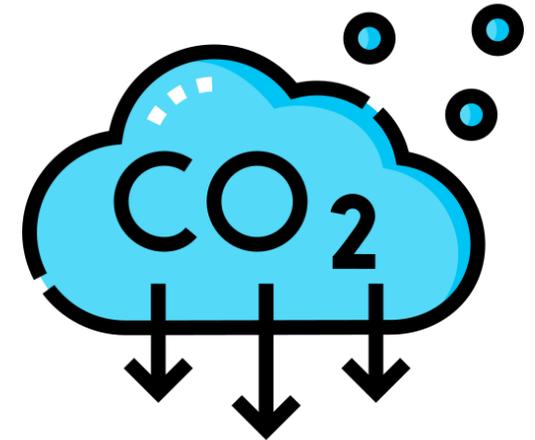

10 sites = 3.6 MW installed solar

Produce 5.4 million kWh per year

Enough to power 420 Texas homes for a year

Avoid 2,945 MTCO<sub>2</sub>e /yr  
69,378 MTCO<sub>2</sub>e by 2050
